This sequence represents interleukin-13 (IL-13) beta receptor. The acid sequences, which are preseptors for interleukin-13 (IL-13); the abovention relates to new purified peptides comprising 380 or 427 amino and 427 am proteins are designated IL-13R beta and alpha respectively. Cc and 427 bet acids affinity for IL-13R beta and alpha respectively. Cc freeptor. Nucleic acids encoding IL-13R beta and alpha are such as loss of heterozygosity and rearrangements or genetic anomalies. They are also used for production of recombinant IL-13R beta and alpha which can be used for production of recombinant IL-13R beta and alpha which can be used for production of recombinant IL-13R beta therapy (blocking synthesis for treatment of inflammation and alberay 11-13 receptors are also useful as antisense molecules for gene of IL-13R receptors are also useful as antisense molecules for gene overproduction of IL-13R. Antibodies are used (in standard of IL-13R. coupled to a toxin also for treatment of saidard of used to identify ligands and modulators of IL-13R at the surface are used to identify ligands and modulators of IL-13R at the surface are specification (AAT86464), which is not the same as that shown in the

Interleukin-13; IL-13; interleukin-13 receptor binding chain; IL-13bc; allergy; asthma; immune complex disorder. Human IL-13 binding chain of the IL-13 receptor. AAW33295 ID AAW35295 standard; Protein; 380 AA. (first entry) 27-MAR-1998 RESULT

The present sequence represents the human interleukin-13 (IL-13) binding chain of the interleukin-13 receptor, designated IL-13bc. IL-13bc in-13bc proteins, and antibodies raised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used to treat Ing-mediated conditions, e.g. allergy, asthma and immune complex consequence. They are also used to treat immune deficiency (particularly used hamalopoietic progenitor cells), cancer etc., and to increase macrophage contivation, e.g. in vaccination. To potentiate IL-13 activity in vivo, to a cell expressing at least one chain of the IL-13 receptor other than IL-13bc. IL-13bc can also be used in diagnosis to detect in the complex complex of the interval of the New nucleic acid encoding interleukin-13 receptor binding chain and treating immunoglobulin E-mediated diseases, e.g. Graves disease, Collins M, Donaldson D, Fitz L, Neben T, Whitters M; 26..380

The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands that promote proliferation and/or differentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 360
                                                                                                                       This protein comprises a novel human cytokine/peptide hormone receptor, designated the HR-1 receptor, that shows 27% identity and 52% similarity to the interleukin-5 receptor. Its amino acid sequence was deduced from a CDNA clone (see AAV04131) obtained from human testis library. Recombinant HR-1 receptor can be expressed in claimed host cells, and used in a claimed method for identifying compounds which bind to, and activate or inhibit, it. HR-1 receptor activators and agonists can be used to treat, prevent or diagnose predisposition to lowered resistance to infection, asthma, allergic or haematopoletic disorders, e.g. where induced by AIDS, appastic anaemia, neutropaenia or cytotoxic treatments for cancer.
                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                           Nucleic acid sequence encoding human cytokine peptide hormone receptor – useful to treat, prevent or diagnose, e.g. lowered resistance to infection, asthma, allergy or haematopoietic disease
                                                                                                                                                                                                                                         HR-1 antagonists, e.g. antibodies or HR-1 receptor fragments, can
be used to treat conditions associated with HR-1 receptor
overexpression. The antibodies can also be used to determine HR-1
                                                                                                                                                                                                                                                                        receptor levels, since overexpression may be diagnostic of tumours
                                                                                                                                                                                                                                                                                                                                                                              MAFVCLAIGCLYTFLISTTFGCTSSSDTEIKVNPPQDFEIVDPGYLGYLYLQWQPPLSLD

This protein comprises a novel human cytokine/peptide hormone receptor, designated HR-1 receptor. The amino acid sequence was deduced from a cDNA clone (see AAVO4D5) isolated from a human testis cDNA library. It shows 27% amino acid identity and 52% similarity with the human interleukin-5 receptor. Also claimed are solynclectides encoding HR-1 receptor, vector and host cells, an agonist to the polypeptide, antibody against the polypeptide, an tagonist that inhibits the activity of the polypeptide, a process for diagnosing a disease, or a susceptibility to disease, related to expression of HR-1 receptor, and a method for identifying compounds that activate or inhibit the HR-1 receptor. HR-1 receptor protein and polynucleotides can be used for research, compounds that activate or inhibit the HR-1 receptor. HR-1 receptor protein and polynucleotides can be used for research, compounds that activate or inhibit the HR-1 receptor. HR-1 receptor and individuals with tramma and/or increase resistance to infections in individuals with tramma and/or burns, and to prevent, ameliorate, treat, diagnose and/or determine the predisposition to asthma, allergic disorders or disorders of haematopolesis induced by AIDS, aplastic anaemia, congenital or cyclic neutropaemia and/or bone marrow transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120

This, or it's activators or agonists, can be used to treat, prevent or diagnose predisposition to lowered resistance to infection, asthma, allergic or haematopoietic disorders, e.g. where induced by acquired immune deficiency syndrome (AIDS), aplastic anaemia, neutropaenia or cytotoxic treatments for cancer. Antagonists of the receptor, e.g. antibodies or fragments of it may be used to treat conditions associated with overexpression of the HR-1 receptor, e.g. those listed above. Antibodies may also be used to assay levels of HR-1 receptor, overexpression of which may be diagnostic of tumours, by usual

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;
                                                                                                                                                                                                                                                                                                                                The present sequence is that of the interleukin-13 binding chain (IL-13bc) of the human IL-13 receptor, as deduced from an isolated human testis cDNA clone (see AAA77912). IL-13bc is a member of the human testis cDNA clone (see AAA77912). IL-13bc is a member of the haematopoietin receptor family that acts as a mediator of IL-13. The invention provides methods for the recombinant production of IL-13bc polypeptides, including claimed full-length IL-13bc polypeptides, particularly soluble IL-13bc polypeptides, and IL-13bc polypeptides, particularly soluble IL-13bc polypeptides, of IL-13 and its receptor) can be used to treat conditions in which IL-13 and its receptor) particularly IgE-mediated conditions and seases including atopy, allergy, asthma, immune complex diseases (e.g. lupus, nephrotic syndrome, nephritis, glomerulonephritis, thyroiditis and Grave's disease), lung inflammation, immunedeficiency, and cancer. Since IL-13 inhibits macrophage activation, e.g. in vaccination, treatment of mycobacterial or intracellular organisms or parasite infections. IL-13bc proteins may also be used to potentiate the effects of IL-13 in vitro and in vivo, as diagnostic agents, and to screen for agents capable of binding to IL-13bc or IL-13 receptor, or which interfere with the
                                                                                                                                                                                                                                                  New polynucleotide encoding an interleukin-13 (IL-13) binding chain of
an IL-13 receptor for treating IgE-mediated conditions, such as atopy,
asthma, Grave's disease and inflammatory conditions of the lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180

          or from healing of a wound which is a surgical incision, or inhibiting formation of tissue fibrosis which affects tissues such as liver, skin epidermis and endodermis, muscle, tendon, cartilage, cardiac tissue, pancreas, lung, uterine tissue, neural tissue, testis, ovary, adrenal gland, artery, vein, colon, small intestine, biliary tract and gut. It is also used in the treatment or modulation of various IL-13 related conditions such as allergic conditions, nephrotic syndrome, thyroiditis, Grave's disease and cancer. The present sequence is human interleukin (IL)-13 building chain of IL-13 receptor (IL-13bc). IL-13bc protein is used to potentiate the effects of IL-13. This protein is also used to enhance macrophage activation and hence can be used in vaccination or treatment of mycobacterial or parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                    120

by administering an interlement of IL-13) antagonist or an IL-4 chain (IL-13bc; Janeagonist or an IL-4 chain (IL-13bc; Janeagonist is the IL-13 binding chain (IL-13bc; Janeagonist is the IL-13 binding soluble fragments thereof. The method is useful for treating or inhibiting the formation of tissue fibrosis resulting from the healing of a wound, including a surgical incision wound, or from infection with schistosoma. The method may be used to treat fibrosis in a variety of tissues, particularly liver tissue, but also skin epidermis, skin endodermis, muscle, tendon, cartilage, cardiac tissue, pancreatic tissue, lung tissue, uterine tissue, meaning the shadon adrend, artery, vein, colon, small intestine, biliary tract or gut tissue. The present sequence represents human IL-13bc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a novel ligand-binding receptor, Zcytor2, which shares homology with cytokine receptors and was isolated from a human testis cDNA library. The reculting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands that promote proliferation and/or fufferentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise infertility. Antagonists of this receptor may be used to characterise infertility. Antagonists of this receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

This sequence represents a novel ligand-binding receptor, Zcytor2, which shares homology with cytokine receptors and is isolated from testita tissue obtained from a Celebus macaque. The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands promoting proliferation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands.

C Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor, and therapeutically as antagonist.

ö
treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.

                The IL-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one IL-13 activity. They can be used for treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.

The present sequence represents the murine interleukin-13 (IL-13) binding chain of the interleukin-13 receptor, designated IL-13bc. IL-13bc acts a mediator of the known biological activities of IL-13bc. IL-13bc acts a mediator of the known biological activities of IL-13bc. Recombinant IL-13bc proteins, and antibodies raised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used to treat ign-mediated conditions, e.g. allergy, asthma and immune complex disorders, especially lupus, nephritis, thyroiditis and Grave's disease. They are also used to treat immune deficiency (particularly in haematchoeletic progenitor cells), cancer etc., and to increase macrophage city activity is combined with IL-13bc and the mixture applied, in vivo, to a cell expressing at lesst one chain of the IL-13 receptor continuous than IL-13bc. IL-13bc can also be used in diagnosis to detect expression of IL-13, its receptor binding chain, and to raise specific antibodies which may be useful for treating some tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180

New polynucleotide encoding an interleukin-13 (IL-13) binding chain of an IL-13 receptor for treating IgE-mediated conditions, such as atopy, asthma, Grave's disease and inflammatory conditions of the lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of the interleukin-13 binding chain (IL-13bc) of the murine IL-13 receptor, as deduced from an isolated c3H/HeJ mouse thymus cDNA clone (see AAA7911). IL-13bc is a member of the haematopoietin receptor family that acts as a mediator of IL-13. The invention provides methods for the recombinant production of IL-13bc polypeptides, including claimed full-length IL-13bc, its extracellular domain, and its intracellular domain. IL-13bc polypeptides, particularly soluble IL-13bc polypeptides, and IL-13 receptor inhibitors (e.g. antagonists of the interaction of IL-13 and its receptor) can be used to treat conditions in which IL-13 is implicated, particularly IGE-mediated conditions and
                                                                                                                                                           cytokine receptor; haematopoietin receptor; atopy; allergy; asthma; immune complax disease; lupus; nephritis; thyroiditis; grave's disease; inflammatory; infection; therapy; antiallergic; antiinflammatory; antiasthmatic; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (e.g. lupus, nephrotic syndrome, nephritis, glomerulonephritis, thyroiditis and Grave's disease), lung inflammation, immunodeficiency, and cancer. Since IL-13 inhibits macrophage activation, IL-13bc proteins can also be used to enhance macrophage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diseases including atopy, allergy, asthma, immune complex diseases

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                               1 MAFVCLAIGCLYTFLISTTF......TGLLLRKPNTYPKMVRCVTL 378
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 4,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CONTRIBUTED THIS IS THE RECEPTOR FOR INTERLEUKIN-5. THE ALPHA CHAIN
TO CHAIL 66:1175-1184(1991).
CHAIN STOIL-5.
CHENDIAL THIS IS THE RECEPTOR FOR INTERLEUKIN-5. THE ALPHA CHAIN
TO SUNDSTITE HETERODIMER OF AN ALPHA AND A BETA CHAIN. THE BETA
CHAIN IS COMMON TO THE IL-3, IL-5 AND GM-CSF RECEPTORS.
CHENDIAL IS COMMON TO THE IL-3, IL-5 AND GM-CSF RECEPTORS.
CHENDIAL STOCATION: TYPE I MEMBRANE-BOUND FORM (SHOWN HERE), SOLUBLE FORM S1 AND SOLUBLE FORM S2, ARE PRODUCED BY
ALTERNATIVE SPLICING.
CHENDIAL SPLICINGS TO THE CYTOKINE FAMILY OF RECEPTORS.
CHENDIAL STOLES AND SOLUBLE FORM S2. ARE PRODUCED CHENT STOLES SPECIFICITY: EXPRESSED ON EOSINOPHILS AND BASOPHILS.
CHENDIAL SPLICITY STOLES STORE STOKEN S2. ARE PRODUCED SY ALTERNATIVE SPLICITY.
CHENDIAL SPLICITY STOLES STOKE STOKEN S2. ARE PRODUCED SY ALTERNATIVE SPLICITY.

Submitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.

L. Submitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.

C. I- FUNCTION: BINDS IL-13 WITH A LOW AFFILTHIY. TOGETHER WITH IL-4R-
ALPHA CAN FORM A FUNCTIONEL RECEPTOR FOR IL-13. ALSO SERVES AS AN

C. CHAIN FOR IL-4 SIGNALING, BUT COMMON CYTOKINE RECEPTOR GAMMA

C. CHAIN FOR IL-4 SIGNALING, BUT CANNOT REPLACE THE FUNCTION OF

GAMMA-C IN ALLOWING ENHANCED IL-2 BINDING ACTIVITY.

C. SUBUNIT: INTERLEUKIN-13 RECEPTOR IS A COMPLEX OF ILAR-ALPHA,

C. SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

C. SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

C. SINGLER LOCATION IN B-CELLS, TOELLS IN HEART, LIVER,

C. SIMILARITY: CONTAINS I IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.

C. SIMILARITY: CONTAINS I FIBRONECTIN TYPE III-LIKE DOMAIN.

C. SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPONS.

-!- SUBCLILULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- DISEASE: DEFECTS IN ILISE ARE THE CAUSE OF A SEVERE COMBINED IMMUNODEFICIENCY MHICH IS KNOWN AS AGAMMAGLOBULINEMIA, SWISS TYPE OR X-LINKED SEVERE COMBINED IMMUNODEFICIENCY DISEASE (KSCID).
-!- SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
-!- SIMILARITY: CONTAINS I FIBRONECTIN TYPE III-LIKE DOMAIN.

```
This sequence represents interleukin-13 (IL-13) beta receptor. The invention relates to new purified peptides comprising 380 or 427 amino acid sequences, which are receptors for interleukin-13 (IL-13); the 380 and 427 am proteins are designated IL-13R beta and alpha respectively. The IL-13R beta has high affinity when associated with the IL-4 receptor. Nucleic acids encoding IL-13R beta and alpha are used as diagnostic probes to identify aberrant synthesis or genetic anomalies such as loss of heterozygosity and rearrangements, or chromosomal anomalies. They are also used for production of recombinant IL-13R beta and alpha which can be used as IL-13 antagonists, specifically to regulate IL-13-induced responses for treatment of inflammation and regulate IL-13-induced responses for treatment of inflammation and relargy (blocking synthesis of IL-13R). Antibodies are used (in standard immunication and alpha which can be used so useful as antisense molecules for the therapy (blocking synthesis of IL-13R). Antibodies are used (in standard immunication) and sexpense in the standard immunication and the standard immunication and sexpense in the standard immunication and sexpense in the sexpense in the standard immunication and sexpense in the sexpense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                              of IL-13 receptors; when coupled to a toxin also for treatment of overproduction of IL-13R. Cells that express IL-13R at the surface are used to identify ligands and modulators of IL-13R. Note: IL-13R beta is encoded by the nucleic acid sequence shown in Figure 2a in the specification (AAT85828).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Interleukin-13; IL-13; interleukin-13 receptor binding chain; IL-13bc; mediator; IL-13 receptor binding inhibition; IgE-mediated condition; allergy; asthma; immune complex disorder.

The present sequence represents the human interleukin-13 (IL-13) binding chain of the interleukin-13 receptor, designated IL-13bc IL-13bc acts a mediator of the known biological activities of IL-13bc. IL-13bc acts a mediator of the known biological activities of IL-13bc. Recombinant IL-13bc proteins, and antibodies raised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used to treat ign-mediated conditions, e.g. allergy, asthma and immune complex disorders, especially lupus, nephritis, thyroiditis and Grave's disease. They are also used to treat immune deficiency (particularly in heavily propertic progenitor cells), cancer etc., and to increase macrophage cellvation, e.g. in vaccination. To potentiate IL-13 activity, a protein with such activity is combined with IL-13bc and the mixture applied, in vivo, to a cell expressing at least one chain of the IL-13 receptor context than IL-13bc. IL-13bc can also be used in diagnosis to detect expression of IL-13, its receptor binding chain, and to raise specific antibodies which may be useful for treating some tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120
